Database Programming with PL/SQL

Trapping Oracle Server Exceptions

Objectives

This lesson covers the following objectives:

- Describe and provide an example of an error defined by the Oracle server
- Describe and provide an example of an error defined by the PL/SQL programmer
- Differentiate between errors that are handled implicitly and explicitly by the Oracle server
- Write PL/SQL code to trap a predefined Oracle server error

Objectives (cont.)

This lesson covers the following objectives:

- Write PL/SQL code to trap a non-predefined Oracle server error
- Write PL/SQL code to identify an exception by error code and by error message

Purpose

PL/SQL error handling is flexible and allows programmers to use both errors defined by the Oracle server and errors defined by the programmer. This lesson discusses predefined and non-predefined Oracle server errors.

Predefined errors are the common Oracle errors for which PL/SQL has predefined exception names. Non-predefined errors make use of the ORA error codes and messages. The syntax is different for each, but you can trap both kinds of errors in the EXCEPTION section of your PL/SQL program.

Exception Types

This lesson discusses predefined and non-predefined Oracle server exceptions.

Exception	Description	Instructions for Handling
Predefined Oracle server error	One of approximately 20 errors that occur most often in PL/SQL code	You need not declare these exceptions. They are predefined by the Oracle server and are raised implicitly (automatically).
Non-predefined Oracle server error	Any other standard Oracle server error	Declare within the declarative section and allow the Oracle Server to raise them implicitly (automatically).
User-defined error	A condition that the PL/SQL programmer decides is abnormal	Declare within the declarative section, and raise explicitly.

Handling Exceptions with PL/SQL

There are two methods for raising an exception:

- Implicitly (automatically) by the Oracle server:
 - An Oracle error occurs and the associated exception is raised automatically.
 - For example, if the error ORA-01403 occurs when no rows are retrieved from the database in a SELECT statement, then PL/SQL raises the exception NO_DATA_FOUND.

Handling Exceptions with PL/SQL (cont.)

- Explicitly by the programmer:
 - Depending on the business functionality your program is implementing, you might have to explicitly raise an exception.
 - You raise an exception explicitly by issuing the RAISE statement within the block.
 - The exception being raised can be either user-defined or predefined. These are explained in the next lesson.

Two Types of Oracle Server Errors

When an Oracle server error occurs, the Oracle server automatically raises the associated exception, skips the rest of the executable section of the block, and looks for a handler in the exception section.

Two Types of Oracle Server Errors (cont.)

There are two types of Oracle server errors:

- Predefined Oracle server errors:
 - Each of these errors has a predefined name.
 - For example, if the error ORA-01403 occurs when no rows are retrieved from the database in a SELECT statement, then PL/SQL raises the predefined exception-name NO_DATA_FOUND.

Two Types of Oracle Server Errors (cont.)

- Non-predefined Oracle server errors:
 - Each of these errors has a standard Oracle error number (ORA-nnnnn) and error message, but not a predefined name.
 - You declare your own names for these so that you can reference these names in the exception section.

Trapping Predefined Oracle Server Errors

Reference the predefined name in the exception handling routine.

- Sample predefined exceptions:
 - -NO DATA FOUND
 - -TOO MANY ROWS
 - -INVALID CURSOR
 - -ZERO DIVIDE
 - -DUP VAL ON INDEX

Trapping Predefined Oracle Server Errors (cont.)

For a partial list of predefined exceptions, refer to the short list available from the Student Resources in Section 0.

For a complete list of predefined exceptions, see the PL/SQL User's Guide and Reference.

Trapping Predefined Oracle Server Errors (cont.)

The following example uses the TOO MANY ROWS predefined Oracle server error. Note that it is not declared in the DECLARATION section.

```
DECLARE
  v lname VARCHAR2(15);
BEGIN
  SELECT last name INTO v lname
    FROM employees WHERE job id = 'ST CLERK';
  DBMS OUTPUT.PUT LINE('The last name of the ST CLERK is: '||v lname);
EXCEPTION
  WHEN TOO MANY ROWS THEN
    DBMS OUTPUT.PUT LINE (' Your select statement retrieved multiple
rows. Consider using a cursor.');
END;
```

Trapping Several Predefined Oracle Server Errors

This example handles TOO_MANY_ROWS and NO_DATA_FOUND, with an OTHERS handler in case any other error occurs.

```
DECLARE

v_lname VARCHAR2(15);

BEGIN

SELECT last_name INTO v_lname

FROM employees WHERE job_id = 'ST_CLERK';

DBMS_OUTPUT.PUT_LINE('The last name of the ST_CLERK is: '||v_lname);

EXCEPTION

WHEN TOO_MANY_ROWS THEN

DBMS_OUTPUT.PUT_LINE ('Select statement found multiple rows');

WHEN NO_DATA_FOUND THEN

DBMS_OUTPUT.PUT_LINE ('Select statement found no rows');

WHEN OTHERS THEN

DBMS_OUTPUT.PUT_LINE ('Another type of error occurred');

END;
```

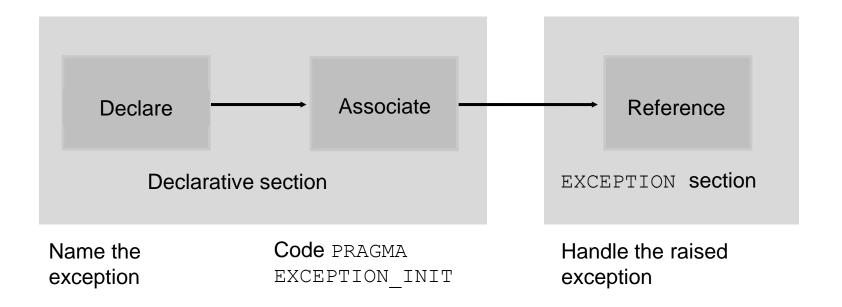

Trapping Non-Predefined Oracle Server Errors

Non-predefined exceptions are similar to predefined exceptions; however, they do not have predefined names in PL/SQL. They are standard Oracle server errors and have ORA- error numbers.

You create your own names for them in the DECLARE section and associate these names with ORA- error numbers using the PRAGMA EXCEPTION INIT function.

Why is Exception Handling Important? (cont.)

Trapping Non-Predefined Oracle Server Errors (cont.)

- You can trap a non-predefined Oracle server error by declaring it first. The declared exception is raised implicitly. In PL/SQL, the PRAGMA EXCEPTION INIT tells the compiler to associate an exception name with an Oracle error number.
- This allows you to refer to any Oracle Server exception by name and to write a specific handler for it.

Non-Predefined Error

Examine the following example.

```
BEGIN
INSERT INTO departments
   (department id, department name) VALUES (280, NULL);
END;
```

```
ORA-01400: cannot insert NULL into ("USVA TEST SQL01 S01".
"DEPARTMENTS". "DEPARTMENT NAME")
```

The INSERT statement tries to insert the value NULL for the department_name column of the departments table.

However, the operation is not successful because department_name is a NOT NULL column. There is no predefined error name for violating a NOT NULL constraint.

The way to work around this problem is to declare you own name and associate it with the ORA-01400 error.

1. Declare the name of the exception in the declarative section.

```
DECLARE
  e insert excep EXCEPTION;
  PRAGMA EXCEPTION INIT
      (e insert excep, -01400);
                                                   Syntax:
                                                  exception name EXCEPTION;
BEGIN
  INSERT INTO departments
                                                  where EXCEPTION is the
    (department id, department name)
    VALUES (280, NULL);
                                                  name of the exception
EXCEPTION
  WHEN e insert excep
    THEN
      DBMS OUTPUT.PUT LINE('INSERT FAILED');
END;
```

2. Associate the declared exception with the standard Oracle server error number using the PRAGMA EXCEPTION INIT function.

```
DECLARE
  e insert excep EXCEPTION;
  PRAGMA EXCEPTION INIT
       (e insert excep, -01400);
                                                      PRAGMA EXCEPTION INIT
                                                      (exception,
BEGIN
                                                      error number);
  INSERT INTO departments
  (department id, department name)
                                                      where exception
                                                                        is the
    VALUES (280, NULL);
                                                      previously declared
EXCEPTION
                                                      exception name and
                                                      error number is a
  WHEN e insert excep
                                                      standard Oracle server error
    THEN
      DBMS OUTPUT.PUT LINE('INSERT FAILED');
                                                      number, including the
                                                      hyphen in front of it.
END;
```

3. Reference the declared exception name within the corresponding exception-handling routine.

Functions for Trapping Exceptions

When an exception occurs, you can retrieve the associated error code or error message by using two functions.

Based on the values of the code or the message, you can decide which subsequent actions to take.

- SQLERRM returns character data containing the message associated with the error number.
- SQLCODE returns the numeric value for the error code. (You can assign it to a NUMBER variable.)

Functions for Trapping Exceptions (cont.)

SQLCODE Value	Description
0	No exception encountered
1	User defined exception
+100	NO_DATA_FOUND exception
Negative number	Another Oracle Server error number

Functions for Trapping Exceptions (cont.)

You cannot use SQLCODE or SQLERRM directly in an SQL statement. Instead, you must assign their values to local variables, then use the variables in the SQL statement, as shown in the following example:

Terminology

Key terms used in this lesson included:

- Non-predefined Oracle server errors
- Predefined Oracle server errors
- PRAGMA EXCEPTION INIT
- SQLERRM
- SQLCODE

Summary

In this lesson, you should have learned how to:

- Describe and provide an example of an error defined by the Oracle server.
- Describe and provide an example of an error defined by the PL/SQL programmer
- Differentiate between errors that are handled implicitly and explicitly by the Oracle server
- Write PL/SQL code to trap a predefined Oracle server error

Summary (cont.)

In this lesson, you should have learned how to:

- Write PL/SQL code to trap a non-predefined Oracle server error
- Write PL/SQL code to identify an exception by error code and by error message
